

SOC-01 Port Scan Detection – Incident Report

Executive Summary

On 01/03/2026, the SOC detected suspicious network activity targeting the Windows 11 system. The activity was identified as a port scanning attempt originating from IP address 192.168.76.101. The detection rule was triggered based on abnormal network connection behavior. Investigation confirmed reconnaissance activity with no evidence of exploitation. The incident was classified as medium severity and contained at the reconnaissance stage.

Incident Overview

Field	Value
Incident ID	SOC-01-2026-001
Detection Rule	SOC-01 Port Scan Detection
Date Detected	Mar 1, 2026
Time Detected	12:25:26.228
Severity	Medium
Impact Level	Low
Status	Closed
Analyst	Maksym Petrutsa

Detection Details

The alert was triggered by a threshold-based rule configured to detect 10 or more network connection events from a single source IP within one minute using Sysmon Event ID 3 logs.

Affected Assets

List impacted systems.

Asset Name	IP Address	Role
Windows-11	192.168.76.100	Target System

Attack Details

The attacker Ip 192.168.76.101 initiated multiple TCP connection attempts targeting a port 9200 within a short time window.

Timeline of Events

Chronological format.

Time	Event
12:17:45.374	First connection attempt observed
12:18:17.376	Multiple port connections initiated
12:25:01.887	Detection rule threshold met
12:25:26.228	Alert generated in Elastic

Indicators of Compromise (IOCs)

List extracted indicators.

- Source IP: 192.168.76.101
- Target IP: 192.168.76.100
- Port targeted: 9200
- Time range: 7 minutes 40.854 seconds
- Process name: java.exe

Investigation Findings

In this incident, no evidence of exploitation or privilege escalation was observed. Activity remained limited to reconnaissance.

Impact Assessment

Assess risk clearly.

- Data exposure: No
- Service disruption: No
- Unauthorized access: No

Classification:

- Threat Stage: Reconnaissance
- Risk Level: Medium
- Business Impact: Minimal

Containment and Response Actions

- Blocked source IP at firewall
- Monitored for repeated activity
- Documented event
- Reviewed exposed services

Root Cause Analysis

Open network ports were accessible to the attacker's IP within the same network segment.

Recommendations

- Restrict unnecessary open ports
- Implement IDS/IPS
- Enable geo-blocking if applicable
- Strengthen firewall rules

Final Classification

Incident Type: Network Reconnaissance

MITRE Tactic: Reconnaissance

MITRE Technique: T1046 – Network Service Discovery

Incident Status: Closed

Escalation Required: No
